was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi |472214|gb|AR129072.1). a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         / Organisus: "Laxon:9606" |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Outbole stranded containing Keal and Annalli Silves.

Double- stranded cDNA was digested with Real, resulting in blunt ended cDNA of an average 0.1-2 kb in length.

Digested cDNA was split into two sets, one used as is as the driver, the other set was split in half again and each half linked to a different adaptor.

(5.-TCGAGCGCGCCGCGCAGGT-3' or 5'-
AGGCGCGGGGGGCGCCGCGAGGT-3'), to be used as tester.

Subtraction was performed using the Clontech PCR Select CDNA subtraction kit. Pool of two mentally normal male individuals ages 41 and 53 (8-124, 8-141) subtracted by pool of two schizophrenic individuals, male age 44 and female age 56 (8-116, 8-118). Tissues were obtained from the Stanley Neuropathology Consortium (www.stanleylab.org Johnston [(410) 614-3918, nlj@welchlink.welch.jhu.edu]."

was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with 74 DNA polymersas and 74 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Biomedical Polymers Research Bldg., 20 S. 2030 E., SLC, UT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GSS 20-FEB-2001

was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with 74 DNA polymersae and 74 polymuclectide kinase. Adaptor oligomuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophorses. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

POFTWARE Patentin Release #1.0, Version #1.25

CURRENT APPLICATION DATA:

APPLICATION NUMBER: US/08/482,115A

FILING DATE: U7-JUN-1995

CLASSIFICATION: 435

PRIOR APPLICATION DATA:

APPLICATION NUMBER: US 08/330,123

FILING DATE: 27-OCT-1994

PRIOR APPLICATION NUMBER: US 08/722,102

PILING DATE: U7-JUL-1994

ATTORNEY/AGENT INFORMATION:

NAME: SMICH WILLIAM M

REGISTRATION NUMBER: 15389-000830

TELEPHONE: (415) 326-2400

TELEPHONE: (415) 326-2422

INFORMATION FOR SEQ ID NO: 28:
SEQUENCE CHARACTERISTICS:
LENGTH: 28 base pairs

TYPE: nucleic acid

TYPE: TORNEDDIESS: single
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              COMPUTER READABLE FORM:

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                      The present sequence is a PCR primer for a RNA component of human telomerase (RCHT), antisense plasmid. RCHT was derived from a genomic DNA library obtd. from the human lung fibroblast cell line WI-38. The RCHT can be used in the recombinant prodn. of an active telomerase mol., capable of adding sequences to chromosomal DNA telomerase, and in the synthesis of mutant sequences for the detection of mutant mammalian telomerase RNA component polynucleotides. The RCHT may also be used in the identification of telomerase modulating agents, and in the detection of telomerase related, or neoplastic conditions in a patient. Polynucleotides of at least 25 consecutive nucleotides identical, or complementary to the RCHT sequence linked to heterologous

The RNA components of (non) human mammalian telomerase(s) especially from mouse, rat and chinese hamster are all claimed. Antisense oligonucleotides can be used to block the activity of the telomerase; probes and primers can be used in detection; vectors and host cells transformed with the isolated telomerase genes can be used for production of telomerases; RNA and DNA ribozymes and triplex forming oligonucleotides directed against the telomerase genes can be used therapeutically as can plasmids. A mouse which lacks the
         from mouse, rat and chinese hamster are all claimed. Antisense oligonucleotides can be used to block the activity of the coligonucleotides can be used to block the activity of the telomerase; probes and primers can be used in detection; vectors and host cells transformed with the used in detection; vectors and host cells transformed with the localed telomerase genes can be used for production of telomerases; RNA and DNA ribozymes and triplex forming oligonucleotides directed against the telomerase genes can be used therapeutically as can plasmids. A mouse which lacks the telomerase gene (also claimed) can be used for study of telomere regulation in vivo, and the role it plays in immortalisation. Three primers (AATI1040, AATI1043, AATI1044) were used to produce antisense expression plasmids. AATI1040 was used alongside both AATI1043 and AATI1044 to produce two different antisense molecules.

The present invention describes novel Treponema pallidum genes. These genes encode a glycerophosphodiester phosphodiesterase (Gpd), a D15/Gma87 homologue, and proteins with homology to major outer sheath (Msp) proteins of T. denticola. Also described are: (1) an isolated protein capable of inducing a protective immunologic response to T. p. pallidum, T. p. pertenne, or T. p. endemicum, when administered in an effective amount to an animal host; (2) a method of identifying a T. p. pallidum vaccine candidate; (3) a method of inducing a T. p. pallidum vaccine candidate; (1) a method of inducing a T. p. subspecies pallidum, T. p. subspecies pertenne or T. p. subspecies pallidum, T. p. subspecies pertenne or T. p. subspecies candinical sendencum; and (5) a method of determining whether a first and a second clinical isolate of T. p. pallidum are the same or different. The proteins are used, either alone or in combination, in vaccines against Treponemal diseases. He methods may be used to identify vaccine other Treponemal diseases. The methods may be used to identify vaccine candidates, and to determine the origin of a treponemal nucleic acid.
                                                                                                                                                                                                                               ö

               regulation in vivo, and the role it plays in immortalisation.

Four primers (AAT11057, AAT11058 and AAT11059, AAT11060) which are complementary to human telomerase RNA component sequences can be used to identify and amplify homologous sequences from other non-human mammals. The amplified fragments can then be used as probes to identify telomerase genes.
 can be used for study of telomere
                                                                                                                                                                                                                               ö

```
The invention relates to promoter regions from mouse and human telomerase RNA (TR) component genes. The TR gene promoter can be linked to a heterologous gene, especially a gene encoding a cytotoxin, for the rapy of cancer, especially neoplasias. The telomerase is necessary for the unrestricted proliferative capacity of many human cancers. Mutation or dysregulation of the telomerase expression pathway may cause cactivation or upregulation of telomerase expression in cancer. Substances, identified in the methods, can be used to block transcription from the TR gene promoter through interaction of the 5' regulatory sequences. These substances, e.g. antisense oligonucleotides, canscription factors, peptide nucleic acids and factors that disrupt signal transduction, are useful for cancer therapy. In particular, gene therapy vectors (sepecially poffs2-codAupp) comprising the promoter and a ciral thymidine kinase gene can be used to convert a prodrug, e.g. gancyclovir, so that neoplasia can be controlled or treated. Direct down-regulation of telomerase RNA gene through manipulation of telomerase RNA gene through manipulation of the telomerase of the angine of the brown of the cloning of the convert and and the cloning of the brown of the cloning of the convert and coloning of the brown of the cloning of the convert and coloning of the convert and coloning of the convert and coloning the promoter the coloning of the convert and coloning the promoter and coloning the convert and coloning the coloni

The invention relates to promoter regions from mouse and human telomerase RNA (TR) component genes. The TR gene promoter can be linked telomerase RNA (TR) component genes. The TR gene promoter can be linked to a heterologous gene, especially a gene encoding a cytotoxin, for the unrestricted proliferative capacity of many human cancers. Mutation or dysregulation of the telomerase repression pathway may cause reactivation or upregulation of telomerase expression in cancer.

Substances, identified in the methods, can be used to block transcription from the TR gene promoter through interaction of the 5' regulatory sequences. These substances, e.g. antisense oligonucleotides, transcription factors, peptide nucleic acids and factors that disrupt signal transduction, are useful for cancer therapy. In particular, gene therapy vectors (especially pGT62-codAupp) comprising the promoter and a viral thymidine kinase gene can be used to convert a producy e.g. cancyclovir, so that neoplasia can be controlled or treated. Direct down-regulation factors may be effective anticancer therapy and the cloning of the hTR gene promoter activity. Sequences AAZ07681-95 represent PCR primers for amplifying mouse TR gene (terc) promoter sequence.

```
The present sequence represents a primer used in the isolation of a tick derived cysteine protease. The present invention also describes a tick salivary gland antigen related immunogen and a tick derived serine protease. A nucleotide sequence encoding any of the above proteins can be used in a vaccine against tick carried infections for domestic animals such as cattle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Lyme disease, spirochete, antibacterial, Borrelia, infection, vaccine, Lyme borreliosis, veterinary, PCR, primer, ospA, ss.

The invention relates to promoter regions from mouse and human

telomerase RNA (TR) component genes. The TR gene promoter can be linked

to a heterologous gene, especially a gene encoding a cytotoxin, for

therapy of cancer, especially neoplasias. The telomerase is necessary

the unrestricted proliferative capacity of many human cancers. Mutation

or dysregulation of the telomerase expression in cancer.

Cor dysregulation of the methods, can be used to block transcription

from the TR gene promoter through interaction of the 5' regulatory

sequences. These substances, e.g. antisense oligonucleotides,

transcription actors, peptide nucleic acids and factors that disrupt

signal transduction, are useful for cancer therapy. In particular, gene

therapy vectors (especially port82-codAupp) comprising the promoter and a

cutral thymidine kinase gene can be used to convert a prodrug, e.g.

transcription of telomerase RNA gene through manipulation of f

cutral thymidine factors may be effective anticancer therapy and the cloning

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                The invention relates to a pharmaceutical composition comprising at least one of: (a) a polypeptide (I) comprising fully defined sequences of ABB77511, ABB77514 or ABB77512 or the corresponding polypeptide from other Borrelia or their immunogenic fragments; (b) nucleic acids (II) that encode (I) or sequences that hybridise with them under stringent conditions; or (c) antibodies directed against (I). The antibodies are used for diagnosis of Borrelia infection (Lyme borreliosis) and in vaccines for treating or preventing Borrelia infections, in human or veterinary medicine. The present sequence is that of a PCR primer for amplification of a Borrelia burgdorferi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                              Pharmaceutical composition comprises Borrelia antigens and encoding nucleic acid, useful for diagnosis, treatment and prevention of Lyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           nerase RNA; TR; promoter; cytotoxin; cancer; neoplasia; terc;

invention relates to genotyping human galanin receptor (GALR1) gene

gene present in the individual, the identity of the nucleotide pair at one or more polymorphic sites. The method is useful for determining whether an individual has a haplotype or haplotype pairs defined in the pecification. This is useful for improving the efficacy and reliability of several steps in the discovery and development of drugs for treating cliseases associated with GARIA activity, e.g., infectious distribute and growth hormone deficiency, to validate GALRI as candidate agent for treating a specific condition or disease predicted to be associated with GALRI activity. The method is useful to screen for compounds to the GALRI activity. The method is useful to screen for compounds to treating a specific condition or disease predicted to be associated with GALRI activity. The method is useful to screen for compounds to treating activity. The method is useful to screen for compounds to treating activity. The polymucleotide or variant is useful in studying the expression and function of GALRI, and in expressing GALRI polymucleotide or variant is useful for studying the expression of the GALRI isogenes in vivo, for in vivo screening and testing of drugs targeted against GALRI protein, and for studying the testing of drugs targeted adungs targeting called the variation on the biological activity for in vivo screening confident drugs targeting coligonation in the man GALRI isogenes in vivo, for in vivo screening confident called the variation on the biological activity of GALRI general and for the treatment of infectious diarrhoes and growth hormone insufficiency. Associated and proventing and properties of the variation on the properties of the variation of galring the properties of the variation on the properties of the variation of the GALRI isogenes in vivo, for in vivo screening confident days targeted and growth hormone insufficiency. Assument 598408 represent human GALR1 gene allele-specific oligonucleotides used detect GALR1 gene polymorphisms as described in the method of the invention.

cof an individual, involving determining for the two copies of the GALRI cene present in the individual, the identity of the nucleotide pair at one or more polymorphic sites. The method is useful for determining cone or more polymorphic sites. The method is useful for determining cone or more polymorphic sites. The method is useful for determining cone or male a haplotype or haplotype pairs defined in the specification. This is useful for improving the efficacy and reliability of seases associated with GALRI activity, and reliability of diseases predicted to be associated with GALRI activity, and in the design of clinical trials of candidate drugs for treating a specific condition or disease predicted to be associated with GALRI activity, and in the design of clinical trials of candidate drugs for treating a specific condition or disease predicted to be associated with GALRI activity. The method is useful to screen for compounds targeting GALRI to treat a specific conditions or disease associated with GALRI activity. A GALRI polymucleotide or variant is useful in creating activity. The polymucleotide or variant is useful for related to GALRI activity. The polymucleotide or variant is useful for related to GALRI activity. The GALRI isogenes in vivo, for in vivo screening and testing of drugs targeted against GALRI protein, and for studying the capture or the biological activity of GALRI as well as on the biological activity of GALRI is well as on the biological activity of GALRI for treatment

of infectious diarrhoea and growth hormone insufficiency. AAS98289-AAS98408 represent human GALRI gene allele-specific oligonucleotides used to detect GALRI gene polymorphisms as described in the method of the

invention.

The sequences given in AAQ49657-707 are antisense oligonucleotides which contain altered inter-sugar linkages, pref. phosphorothionate linkages. These oligomers bind with the protein kinase C (PKC) mRNA at the transcription initiation site, the translation initiation site, the S' cap region, an intron/exon boundary, coding sequences or sequences in the 5'- or 3'-untranslated regions. These oligonucleotides may be used in diagnostics, therapeutics, prophylaxis and as research reagents. The numbers allocated to the oligomucleotides are relative to the first residue to be sequenced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   on the CDNA, which is 28 residues upstream of the ATG start codon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antisense; oligonucleotide; inter-sugar linkage; protein kinase C; phosphorothionate linkage; PKC; transcription initiation site; translation initiation site; cap region; intron/exon boundary; diagnosis; therapeutics; prophylaxis; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to genotyping human galanin receptor (GALKI) gene of an individual, involving determining for the two copies of the GALKI Come or more polymorphic sites. The method is useful for determining whether an individual has a haplotype or haplotype pairs defined in the one or more polymorphic sites. The method is useful for determining whether an individual has a haplotype or haplotype pairs defined in the gaseification. This is useful for improving the efficacy and reliability of general steps in the discovery and development of drugs for treating diseases associated with GALKI activity, e.g., infectious diarrhoes and growth hormone deficiency, to validate GALKI as a candidate agent for treating a specific condition or disease predicted to be associated with GALKI activity, and in the design of clinical trials of candidate drugs for treating a specific condition or disease predicted to be associated with GALKI activity. The method is useful to screen for compounds targeting GALKI activity. The method is useful to variant is useful for studying the expression and function of GALKI, and in expressing GALKI protein for use in screening for candidate drugs to treat diseases related to GALKI activity. The polymucleotide or variant is useful for studying expression of the GALKI isogenes in vivo, for in vivo screening and testing of drugs targeted against GALKI for the treatment of fine binding affinity of candidate drugs targeting GALKI sevelul so the binding affinity of candidate drugs targeting GALKI for the treatment of incentions distrible and incomponential protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

the backbone subunits are composed of Nacetyl
N-(2-aminoethyl)glycime peptide residues, the
nucleobase being attached covalently to the
acetyl group and the peptide linkage being
formed by condensation of the glycine
carboxy group of one residue with the amino
group of the 2-aminoethyl moiety in the next
residue"
                          The sequences given in AAQ49657-707 are antisense oligonucleotides which contain altered inter-sugar linkages, pref. phosphorothionate linkages. These oligomers bind with the protein kinase C (PKC) mRNA at the transcription initiation site, the translation initiation site, the S' cap region, an intron/exon boundary, coding sequences or sequences in the 5'- or 3'-untranslated regions. These oligonucleotides may be used in diagnostics, therapeutics, prophylaxis and as research reagents. The numbers allocated to the oligonucleotides are relative to the first residue to be sequenced on the cDNA, which is 28 residues upstream of the ATG start codon.
                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New peptide nucleic acid oligomers specific for protein kinase C isozyme(s) - useful as anti:sense molecules for treating PKC mediated disease, e.g. cancer, psoriasis and inflammation
                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PNA oligomer targetting AUG region of PKC-beta isoforms I & II

of naturally occurring nucleobases covalently bound to a polyamide backbone and (b) hybridise to the translation initiation AUG region, coding region, 5' untranslated region (5' UTR) or 3' untranslated region (5' UTR) or 3' untranslated region (3' UTR) of PKC-alpha or its isoforms. The PNAs can be used to target RNA and single stranded DNA (sBDNA) to produce antisense-type gene regulation moieties. They inhibit expression of PKC-alpha and its isoforms (including beta, gamma, delta, epsilon, zeta and eta) and so are useful for treating and diagnosing cell proliferation and differentation processes such as neoplastic, hyperproliferative and inflammatory diseases.
                                                                                                                                                                                                                                                                    and inflammatory diseases.

PNA oligomers have high affinity for complementary single stranded DNA. They are also able to form triple helices in which a first PNA strand binds with RNA or ssDNA and a second PNA strand binds with the resulting
                                                                                                                                                                                                                                                                                                                                                                    double helix or with the first PNA strand. The PNAs possess no significant charge and are water soluble, which facilitates cellular uptake. Futher, since they contain amides of non-biological amino acids, they are biostable and resistant to enzymatic degradation by proteases. The present sequence targets the AUG region of PKC-beta isoforms I & II.

)

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
